CS399 - CS Comps Notes of work — Conrado Peña Lemes
Time Spent: 10 hours — Collaborators:

14/10/26: Looked into how and why my videos are being saved weird, yolo does have a native way of saving images with predictions which I will be testing shortly after looking better into whether or not we can save videos and how to do that.
A fun little thing that I did not know is that depending on how your (macbook) computer turns on (and whether or not you have connected it to your phone (iPhone as far as I know) before). Index 0 for video capture might be your phone camera, cause macbooks can use connected iPhones as microphone and camera which is interesting I think. Also a super weird thing to figure out when I was testing the save function and the preview was looking at the ceiling instead of myself
I gotta figure out how to save the bounding boxes as csv. 18/10/26: I have since tested the YOLO video saver, it somehow works less than the opencv one, in that it shows each frame that it sees asd a new image, but when i was trying to save the images it would not work, at least not with webcam which is something important so I will be using the opencv
